chooch

Chooch Lighthouse

Bring every room from planning to go live.

Challenge

Transforming hospital supply rooms and deploying computer vision is a complex undertaking. Hospitals must coordinate teams, decisions and dependencies while keeping daily operations running.

- PAR optimization, room redesign and deployment must move forward together.
- Multiple teams need clear ownership and shared priorities.
- Without a coordinated approach, projects can stall and become difficult to scale.

Solution

Lighthouse turns each room into a shared workspace for planning and rollout. Open a room to see its scan, blueprint, assets, materials, notes and current stage. Assign work, mark priorities and follow the steps that lead to go live.

Instead of piecing together status updates, teams can see what is ready, what comes next and who needs to act.

A clearer path to installation

From the first site survey to the final room checks, Lighthouse keeps the information behind each decision connected to the room. Stakeholders can review progress, installation crews can find the materials they need, and teams can direct attention to rooms that need action

Make the next step visible

One room record brings together the plan, progress, equipment and assigned work—so the teams working towards making a room go-live can work from the same information

Capabilities

Room plans and version context

Keep 3D scans and manually prepared blueprints accessible, with comments that flag when a new survey is needed.

Go live progress

See completed and upcoming steps, field notes, estimated dates and the status of each room.

Asset and materials visibility

Find cameras, network equipment and installation materials associated with each room.

Tasks, roles and priorities

Assign room design work to teams, set high priority rooms and make ownership visible.

From one room to many

A consistent room workflow supports coordination as projects expand across departments, floors and hospital sites.
